

Q.2

Step 1 : Start

Step 2 : Set Current floor = 0

Step 3 : $i = 0$

Step 4 : $i < n$ → Processed to Step 5, otherwise Step 9

Step 5 : Enter the required floor

Step 6 : If Required floor $>$ current floor More upward

Else if Required floor $<$ current floor More downward

Else At Opening door

Step 7 : $i = i + 1$

Step 8 : Go Step 4

Step 9 : End

PAC

Given Data

- N (Total no of floor required)
- List of requested floor

Required Output

Moving upward, Downward
Door opening

Processing

- Loop counter $i = 0$

Comparison of Req floor vs Current floor

- Loop increment $i = i + 1$

Condition

Elevator always start at 0

Must handle exactly

N requests

State update after every
loop

IPO:

Input	Processing Steps	Outputs
• N (Total Requests)	Initialize	Moving up
• Requested floor	current-floor = 0 if $i = 0$	• Moving down
	• Read Input for requested floor If Requested > current Move upward for less Move downward Else opening door	• Door opening
	• Increment $i = i + 1$	

Pseudocode:

Begin

Set current-floor = 0

$N = 5$

$i = 0$

While $i < N$ Do

Display "Enter required floor"

If Requested floor $>$ current-floor
Display Moving up

Else If Requested $<$ current-floor
Moving Down ward

Else Opening Door

Set $i = i + 1$

End While

End If

End
