Pseudo-Codes ⇒ Q=1

Begin

Read total_rows
Input Seat_per_row
Input Seating_grid [total_rows][seat_per_row]

// 0 = empty , 1 = booked
// number of seat needed together

middle_row = total_row / 2
booked = False

For r from middle_row To total_rows - 1

count = 0
For c from 0 To seat_per_row - 1
If seating_grid [r][c] == 0 then

count = count + 1
If count == k then

```
For i (c-k+1) to c
    Seating-grid [r][i] = 1
End for

booked = True
Break
End if
Else
    count = 0
End if  End For
If Booked == True Then Break
Enist if
End for
```

```
1. Display seat per row
