Question 2:-

Pesudocode

```
Begin
function Sum-to-div(num)
    sum = 0
for i from 1 to num-1

If num % i == 0 then
    Sum = Sum + i
End If  & For

Return sum;

Main function
Take Input n
total-pairs = 0
for i = 0 to n-1
    a = i+1
    b = Sum-to-div(a)
```

If b > a and b <= n then
If sum-to div (b) == a then

Print ("(", a ", " b, ")")

total-pair = total-pair + 1

End If
End If
End for

Print "Total pair %d", total-pairs)

End

Input = n : An integer up to program search for pairs

Output:
Printed Pairs of no(a,b) that satisfy divisor sum Condition.
Total pairs : The total count of such valid pairs found
