Begin
Read s (number of sensors)
Read h ( number of hourly readings)

// Call fn
Call getReading (s, h, temp)
for i = 0 to s-1
Initialize total = 0 , critical = 0 , warning = 0,
streak = 0 , max = 0

Set max = temp [i] [0]
Set min = [temp [i] [0]

for j = 0 to h-1
val = tem [i] [j]
total = tot + val

If val > max , max = val
If val < min , min = val

```
If Val >= 40 then
   critical = critical + 1

Else if Val >= 35 && Val <= 39 then
      Warning = Warning + 1
   End if
If Val >= 35 then
   streak = streak + 1
   If streak > max-streak then max-streak

Else
      streak = 0
End if
End for
   avg = total / 10
Print  sensor stats (tot, avg, max, min,
      critical, max-streak)
   End for
      Call find highest avg (s, 10, temp, &top_avg)
   Print  top-sensor & top-avg
End
```

Input:

S: Number of sensor
h: number of hourly reading per sensor
temp [s] [h] . 2D array of temp

Output:

- for each sensor: Total temperature, Avg, Max, Ma
  Critical count >=40, warning count (35-39),
  its longest hot streak (>=35)

- The sensor number with the overall highest
  avg temp & its value
